04 Shotblasting & Grinding

Surface preparation that gives coatings, sealers, overlays, and repairs the profile they need.

WHAT IT IS

Shotblasting and grinding remove old glue, coatings, weak surface material, and contaminants so the next system bonds to sound concrete.

HOW IT'S DONE

- Review the existing floor, desired system, adhesion requirements, and any dust or access concerns.
- Select shotblasting, diamond grinding, edge grinding, or adhesive-removal tooling based on the required surface profile.
- Use dust-control vacuums and organized cleanup so the surface is ready for repair, leveling, coating, sealing, or polishing.

WHAT TO EXPECT

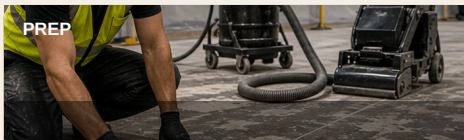

The process is mechanical and controlled. Noise, access, and dust-control planning are discussed up front, especially in active environments.

FINAL RESULTS

A clean, profiled substrate that improves adhesion and reduces the risk of coating failure, delamination, or finish defects.

Built for active facilities, empty spaces, and customers who expect it done right.

Surflex Systems brings 20+ years of practical experience, properly trained crews, safety-focused planning, quality workmanship, appropriate product submittals, and mock ups when needed so the final product matches the expectation. We protect the site, work clean, and aim to leave every space better than we found it.

PREP
Existing coatings, glue, contaminants, and target profile are reviewed first.

INSTALL
Grinding or shotblasting is tied to HEPA dust control and organized cleanup.

HANDOFF
The surface is left prepared for coatings, leveling, sealers, repairs, or polishing.
